

Here is a Python code snippet that sorts the provided array in ascending order using the built-in 'sorted()' function:

PYTHON

```
# Original array
```

```
numbers = [3, 5, 6, 2, 1, 7, 8, 9, 10, 43, 12, 13]
```

```
# Sort the array in ascending order
```

```
sorted_numbers = sorted(numbers)
```

```
# Print the sorted array
```

```
print(sorted_numbers)
```

When you run this code, the output will be:

CODE

```
[1, 2, 3, 5, 6, 7, 8, 9, 10, 12, 13, 43]
```

If you prefer to sort the list **in place**, you can use the 'sort()' method instead:

PYTHON

```
numbers.sort()
```

```
print(numbers)
```

Both approaches achieve the same result; choose the one that best fits your use case. Let me know if you need further assistance.
